

Sabre is a technology solutions provider to the global travel and tourism industry. We offer a broad range of technology solutions including, data-driven business intelligence, mobile, distribution and Software as a Service solutions which are used by travel suppliers (airlines, hotels, car rental outlets, railways, and tour operators) and travel buyers (travel agencies, travel management companies and corporate travel departments) to plan, market, sell, serve and operate their business.

Headquartered in Southlake, Texas, USA, Sabre employs approximately 3,700 people in approximately 60 countries around the world.

As a leading software and technology innovator for over 60 years, we partner with airlines, hoteliers and agencies to make travel happen around the world. We're constantly working to develop the next cutting-edge technology solution and looking for inspired, curious and innovative people to join our team – is that you? If so, Let's get going

Designation: AI Engineer

Role Overview

Welcome to the future of software engineering. We don't just write code; we orchestrate it. As an engineer in our AI-Enabled SDLC Smart Squad, you won't be stuck copy-pasting boilerplate code or "vibe coding". Instead, you will act as a co-pilot, working alongside senior developers (Orchestrators) and advanced AI coding agents to build, test, and deploy enterprise-grade software at hyper-speed. This role is designed for fresh graduates who want to skip legacy development habits and master the next generation of software engineering: Agentic workflows, rigorous test-driven validation, and AI code forensics.

Core Responsibilities (The Agentic SDLC)

Co-Piloting the Agent Execution Loop

- The Mission: Transform well-defined technical specs assigned by Senior Orchestrators (e.g., building React UI layouts, defining microservice endpoint or a machine learning pipeline component) to operational building block of features that redefine travel industry.
- The Execution: Instead of coding from scratch, you will drive, prompt, and guide AI agent execution loops to generate the code implementation, test boundaries thus steering the AI toward the desired outcome.

Guardrail & Test-Driven Validation

- The Mission: Enforce an unyielding "test-first" mindset.
- The Execution: Write test specs (JUnit, PyTest, Groovy, etc.) based on the Orchestrator's technical documentation before the code is finalized. You are the ultimate gatekeeper—no agent-generated code passes your workstation without successfully compiling and running against automated test hooks.

Airtight Code Forensics & Auditing

- The Mission: Master the art of reading, debugging, and auditing AI-generated code.
- The Execution: Shadow senior engineers to review complex, multi-file Pull Requests. You will actively hunt for logical hallucinations, edge-case failures, and ensure the agent strictly adheres to our repository's rules.md (Our AI Constitution).

Observability & Continuous Optimization

- Utilize AI agents to analyze application performance metrics, identify bottlenecks, and generate diagnostic reports.
- Participate in the "Smart Squad" feedback loop by applying AI-assisted refactoring to improve production stability and system efficiency based on real-world telemetry.

Technical Skills & Requirements

Foundational Skill Set

- CS Fundamentals: Strong understanding of Data Structures and Algorithms (DS&A).
- Database Literacy: Familiarity with SQL & NoSQL database design and basic query optimization.
- Asynchronous Logic: Conceptual understanding of parallel tasking, multi-threading, or message queues.
- Testing Mindset: A strong grasp of unit testing principles and why they matter.

The AI Edge (Bonus Skills)

- Experience working with AI coding tools (e.g., GitHub Copilot, Claude, Cursor, ChatGPT, or specialized coding agents).
- An intuitive understanding of how to prompt AI effectively and spot when an LLM is "hallucinating" or writing inefficient code.

SDLC & DevOps Add-ons (What you'll practice here)

- Rudimentary understanding of the end-to-end SDLC (from requirements to deployment).
- Exposure to CI/CD concepts (what, why, and how of pipeline automation).
- Basic familiarity with cloud hyper-scalers (AWS, Azure, or GCP).

Why Join This Squad?

- Accelerated Growth: While your peers are learning syntax, you will be learning system design, code architecture, and AI management.
- High Impact: You will own code validation for real, production-level features.
- Future-Proof Skills: Learn the exact engineering paradigms that will dominate the next decade.

Eligibility Criteria

- **Education degree**: BE/ B.Tech (Computer Science / AI/ML / Data Science)
- **Year of passing**: 2027
- **Marks**: 7 CGPA or more, in all semesters for which results are declared, as on date of hiring event
- **Backlogs**: No active backlogs, as on date of hiring event
- **Compensation offered**: INR 17,72,160 pa (including 5% variable) + INR 3,00,000 Joining Bonus(Payable in two instalments)
- **Stipend offered**: INR 40,000 pm
- **Work Location**: Bengaluru
