

Platform / Linux Systems Intern

Euler Motors | Full-time Internship | On-site

About the role

Work on the infotainment platform powering Euler Motors' electric vehicles.

This role sits at the platform layer — the work closest to the hardware. You'll be helping get peripherals functional, wiring up drivers, and debugging hardware bring-up on real automotive boards.

What you'll work on

- Integrating and debugging **Linux kernel drivers** for peripherals — CAN and audio
 - Writing and debugging **device tree configurations** for bus interfaces, clocks, resets, and GPIOs
 - Working on **native Linux daemons** — platform services that need to start early, before any higher-level framework is up
 - Contributing to the **AGL stack** as we build it out
-

Skills

- Hands-on Linux development experience
- Proficiency in C / C++
- Interest in kernel driver integration
- Some knowledge of device trees
- Familiarity with Linux debug tools (dmesg, i2cdetect, candump, etc.)
