

Intern 1

Job Title: Model-Based Design (MBD) Intern - On-Board Charger

Department: Model Based Design

Job Summary:

Join our Engineering Team as an intern to assist in designing and developing On-Board Charger (OBC) simulations and control logic for electric vehicles. Gain hands-on experience in power electronics, control systems, and embedded systems while contributing to real-world EV charging projects.

Key Responsibilities:

- Develop and validate OBC simulation models.
- Assist in control algorithm OBC design and implementation.
- Support embedded software development and testing.
- Perform data analysis, debugging, and performance evaluation.
- Participate in hardware bring-up and laboratory testing.
- Prepare technical documentation and reports.

Requirements:

- Bachelor's/Master's degree in Electrical Engineering, Power Electronics, Control Systems, Embedded Systems, or related fields.
- Familiarity with MATLAB/Simulink.
- Basic knowledge of embedded C programming.
- Understanding of control systems and power electronics fundamentals.
- Strong analytical and problem-solving skills.

Preferred Skills:

- Model-Based Design (MBD) in MATLAB/Simulink and Stateflow
- Embedded systems development
- Hardware testing and validation

Intern 2

Job Title: Model-Based Design (MBD) Intern - Motor Controller

Department: Model Based Design

Job Summary:

Join our Engineering Team as an intern to assist in designing and developing Motor Controller simulations and control logic for electric vehicles. Gain hands-on experience in electric drive systems, motor control algorithms, and embedded systems while contributing to real-world EV propulsion projects.

Key Responsibilities:

- Develop and validate motor controller simulation models.
- Assist in motor control algorithm design and implementation (torque, speed, and current control).
- Support embedded software development and testing.
- Perform data analysis, debugging, and performance evaluation.
- Participate in inverter and motor system bring-up and laboratory testing.
- Prepare technical documentation and reports.

Requirements:

- Bachelor's/Master's degree in Electrical Engineering, Power Electronics, Control Systems, Embedded Systems, or related fields.
- Familiarity with MATLAB/Simulink.
- Basic knowledge of embedded C programming.
- Understanding of electric machines, motor control, and control systems fundamentals.
- Strong analytical and problem-solving skills.

Preferred Skills:

- Model-Based Design (MBD) in MATLAB/Simulink and Stateflow
- Embedded systems development
- Knowledge of PMSM/BLDC motor control concepts
- Hardware testing and validation

Intern 3

Job Title: Model-Based Design (MBD) Intern - Battery Management System (BMS)

Department: Model Based Design

Job Summary:

Join our Engineering Team as an intern to assist in designing and developing Battery Management System (BMS) simulations and control logic for electric vehicles. Gain hands-on experience in battery technologies, energy management, and embedded systems while contributing to real-world EV battery development projects.

Key Responsibilities:

- Develop and validate BMS simulation models.
- Assist in battery monitoring and control algorithm development (SOC, SOH, balancing, and protection functions).
- Support embedded software development and testing.
- Perform data analysis, debugging, and performance evaluation.
- Participate in battery pack testing and laboratory validation activities.
- Prepare technical documentation and reports.

Requirements:

- Bachelor's/Master's degree in Electrical Engineering, Electronics Engineering, Energy Systems, Embedded Systems, or related fields.
- Familiarity with MATLAB/Simulink.
- Basic knowledge of embedded C programming.
- Understanding of battery systems, control systems, and electrical fundamentals.
- Strong analytical and problem-solving skills.

Preferred Skills:

- Model-Based Design (MBD) in MATLAB/Simulink and Stateflow
- Embedded systems development
- Basic understanding of lithium-ion battery technologies
- Hardware testing and validation

Intern 4

Job Title: Model-Based Design (MBD) Intern - Vehicle Control Unit (VCU)

Department: Model Based Design

Job Summary:

Join our Engineering Team as an intern to assist in designing and developing Vehicle Control Unit (VCU) simulations and control logic for electric vehicles. Gain hands-on experience in vehicle-level control strategies, system integration, and embedded systems while contributing to real-world EV control architecture projects.

Key Responsibilities:

- Develop and validate VCU simulation models using MATLAB/Simulink.
- Assist in the development of vehicle control algorithms and supervisory control logic.
- Support Range Estimation feature development.
- Perform simulation, testing, debugging, and data analysis.
- Support embedded software development and testing.
- Perform data analysis, debugging, and performance evaluation.
- Participate in vehicle integration, system testing, and laboratory validation activities.
- Prepare technical documentation and reports.

Requirements:

- Bachelor's/Master's degree in Electrical Engineering, Electronics Engineering, Mechatronics, Control Systems, Embedded Systems, or related fields.
- Familiarity with MATLAB/Simulink.
- Basic knowledge of embedded C programming.
- Understanding of vehicle systems, control systems, and embedded software fundamentals.
- Strong analytical and problem-solving skills.

Preferred Skills:

- Model-Based Design (MBD) in MATLAB/Simulink and Stateflow
- Embedded systems development
- Basic understanding of EV architecture and vehicle networks
- Hardware testing and validation

Intern 5

Job Title: Model-Based Design (MBD) Intern - Telematics

Department: Model Based Design

Job Summary

Join our Telecommunications Team as an intern to support the development of telematics and connected vehicle solutions for electric vehicles. Gain hands-on experience in Model-Based Design (MBD), vehicle communication systems, GPS-based tracking, data transfer, and embedded systems while contributing to real-world EV connectivity projects.

Key Responsibilities

- Develop and validate MATLAB/Simulink models for telematics applications.
- Assist in the development of Dead Reckoning algorithms for vehicle location estimation.
- Support GPS/GNSS-based vehicle tracking and latitude/longitude calculation.
- Assist in vehicle data acquisition, processing, and cloud communication features.
- Support development of telematics functions such as remote monitoring, vehicle diagnostics, and over-the-air (OTA) data transfer.
- Perform simulation, testing, debugging, and data analysis.
- Support embedded software development and validation activities.
- Participate in laboratory and vehicle testing activities.
- Prepare technical documentation and reports.

Requirements

- Pursuing a degree in Electrical Engineering, Electronics Engineering, Mechatronics, Embedded Systems, Computer Science, or related fields.
- Familiarity with MATLAB/Simulink.
- Basic knowledge of embedded C programming.
- Understanding of communication systems, embedded systems, and control systems fundamentals.
- Strong analytical and problem-solving skills.

Preferred Skills

- Model-Based Design (MBD) in MATLAB/Simulink and Stateflow
- Basic understanding of GPS/GNSS, Dead Reckoning, and vehicle localization techniques
- Knowledge of telematics systems and connected vehicle technologies
- Communication protocols (CAN, UART, SPI, I2C, MQTT, TCP/IP, etc.)
- Cellular communication technologies (4G/5G, LTE, GSM)
- Vehicle diagnostics and data logging concepts
